# Commitment Cards

A proposed Fireflies.ai feature to turn meeting commitments into owned, trackable, and honestly closed actions.

| | |
|---|---|
| **Prepared by** | Jayesh Parihar |
| **Program** | Airtribe – AI-First Product Management |
| **Project** | Fireflies.ai \| Commitment Cards |
| **Document version** | 1.0 \| Proposed V1 |
| **Status** | Capstone concept; requires pilot validation |
| **Research base** | 19 interviews across 3 companies |

| 28% | 45% | 6 months |
|---|---|---|
| Baseline 14-day resolution rate | Target 14-day resolution rate | Proposed target timeframe |

## Product thesis

Fireflies helps teams capture what was discussed. Commitment Cards is designed to help teams manage what happens next: who accepts the work, what it depends on, when it is due, and how it is closed.

**Prototype** https://prototype-jayeshparihar-fireflies.lovable.app/

**Presentation video** https://docs.google.com/videos/d/1QSgAdmdterJbTSX83XRY1lEwKf9WvQEogKgqtLzk15k/play?usp=sharing

# Document control

| Field | Details |
|---|---|
| Owner | Jayesh Parihar |
| Product area | Meeting intelligence / post-meeting workflow |
| Document status | Proposed V1; concept-stage requirements |
| Evidence base | 19 user interviews, competitor review, and a hands-on free-plan teardown |
| Important limitation | The 28% baseline and 45% target are project-level figures; the prototype contains illustrative sample data and is not a production integration. |

# Contents

- 1. Executive summary and product context
- 2. Problem statement and evidence
- 3. Users, needs, and jobs to be done
- 4. Goals, non-goals, and product principles
- 5. Proposed experience and lifecycle
- 6. Functional requirements and acceptance criteria
- 7. Metrics and instrumentation
- 8. Risks, dependencies, and open questions
- 9. MVP scope, rollout, and validation plan

# 1. Executive summary

Commitment Cards is a proposed feature for Fireflies.ai. It converts detected meeting commitments into structured cards with a proposed owner, due date or due-date prompt, source quote, status, and dependency context. Owners can accept, mark an item as not theirs, or reassign it. Once accepted, they can track progress, flag blockers, and close the item through Done, Reassign, or Drop with a reason.

The product hypothesis is that a lightweight workflow layered on top of meeting capture can improve commitment follow-through without requiring teams to adopt another full project-management system or creating an employee-surveillance experience.

# 2. Problem statement and evidence

## Problem statement

Commitments made in meetings are often captured in summaries but are not consistently converted into accepted, dated, dependency-aware work. Ownership and status then become fragmented across CRM tasks, email, messaging apps, calendars, and verbal follow-ups. When a commitment depends on another team, the person communicating with the customer may remain accountable without having visibility or control over the missing input.

## Research base

| Participant group | Count |
|---|---|
| Sales representatives | 10 |
| Team leads | 6 |
| CEOs / founders | 3 |
| Total | 19 |

Interviews covered Uffizio, Mobility Foresights, and Triforce Consultancy. Each conversation explored one real, recent commitment, where it was recorded, who owned it, what dependencies existed, and what happened when it was delayed. A hands-on teardown of the Fireflies free plan was also conducted.

## Observed breakdown categories

| Breakdown stage | Interviews | Pattern observed |
|---|---|---|
| Visibility | 8 | CRM may hold a task but not another team's status; managers chase multiple people. |
| Ownership | 4 | The customer-facing owner depends on another team for the missing piece. |
| Capture | 3 | Details are split across CRM, email, WhatsApp, or calendar. |
| Closure | 3 | Approvals or dependencies delay delivery; closure is not clearly recorded. |
| Change | 1 | Rescheduling or availability changes are not confirmed early. |

**Evidence interpretation:** Visibility was the most frequently reported breakdown in this interview sample. This is directional qualitative evidence, not a statistically representative estimate of all Fireflies users.

# 3. Users, needs, and jobs to be done

| User / stakeholder | Needs | Main concern |
|---|---|---|
| Commitment maker (sales rep / team member) | Know what is expected; accept or correct ownership; track blockers; close work quickly. | Being blamed for another team's delay; duplicate data entry. |
| Manager (team lead) | See team-level owners, statuses, and blockers; reduce manual chasing. | Creating a surveillance-oriented workflow. |
| Buyer (CEO / founder) | Understand closure trends, drop reasons, and whether the workflow creates value. | Adding administration without measurable impact. |
| Administrator (not interviewed) | Fit existing permissions, integrations, and operational practices. | Unvalidated setup, access, and governance needs. |

## Jobs to be done

- When a meeting produces a commitment, I want a proposed action with its source context so I can quickly confirm what was agreed.
- When a commitment is assigned to me, I want to accept, decline, or reassign it so that ownership is explicit and consensual.
- When I depend on another person or team, I want to show that dependency and its status so that delays are visible without misattributing blame.
- When I manage a team, I want a team-level view of progress and blockers so I can remove obstacles rather than repeatedly chase individuals.
- When I evaluate the product, I want outcome trends and drop reasons so I can assess value without ranking employees.

# 4. Goals, non-goals, and product principles

## Goals

- Increase the 14-day commitment resolution rate from 28% to 45% within six months.
- Make proposed ownership explicit and require owner acceptance before work is treated as committed.
- Expose dependencies and blocked status in the same workflow as the commitment.
- Reduce fragmented reminders through one consolidated daily digest.
- Give managers and buyers useful team-level visibility without individual performance rankings.

## Non-goals for V1

- Replacing CRM or project-management products.
- Changing meeting recording, transcription, or the underlying extraction model.
- Automatically determining that a commitment is complete.
- Building individual employee leaderboards or performance rankings.
- Adding calendar time-blocking or a broad project-management suite.

### Product principles

| Principle | Product implication |
|---|---|
| Consent before commitment | A detected action is proposed, not assigned as accepted work, until the owner acts. |
| Honest outcomes | Done, reassigned, and deliberately dropped are distinct, auditable outcomes. |
| Visibility without surveillance | Show status and blockers at team level; do not rank people. |
| Low-friction participation | Use a single digest and allow dependency owners to respond by link without an account. |
| Preserve source context | Keep the meeting, quote, and timestamp available to help users verify the commitment. |

## 5. Proposed experience and commitment lifecycle

The proposed lifecycle begins after a meeting and ends when the commitment has an explicit outcome. The system should preserve the difference between a detected proposal, an accepted commitment, and a resolved outcome.

| Step | User / system action | Expected state |
|---|---|---|
| 1. Detect | Meeting produces one or more candidate commitments. | Proposed |
| 2. Propose | Create a card with title, proposed owner, due date or “By when?” prompt, source quote, and timestamp. | Awaiting acceptance |
| 3. Confirm | Owner chooses Accept, Not mine, or Reassign. | Accepted / returned / reassigned |
| 4. Track | Owner confirms due date and updates status. | Open |
| 5. Expose dependency | Owner adds Waiting on tag and can mark I'm blocked; dependency owner is notified. | Blocked / waiting |
| 6. Respond | Dependency owner uses a link to choose Confirmed, Need more time, or Cannot do this. | Dependency updated |
| 7. Nudge | Daily digest lists items due in the next seven days and blocked items. | Action prompted |
| 8. Close | Owner chooses Done, Reassign, or Drop with a reason. | Resolved / reassigned / dropped |

# 6. Functional requirements and acceptance criteria

Priority definitions: Must = required for the proposed V1 experience; Should = valuable but can follow the core workflow if pilot scope requires it.

| ID / priority | Requirement | Acceptance criteria |
|---|---|---|
| R1 · Must | Create a proposed card for each detected commitment. | Card shows title, proposed owner, due date or “By when?” prompt, source meeting, source quote, and timestamp. The item is clearly marked as proposed. |
| R2 · Must | Owner consent: Accept / Not mine / Reassign. | No item is treated as an accepted commitment before owner action. Not mine returns the item for correction; Reassign records the new proposed owner. |
| R3 · Must | One-click Done / Reassign / Drop. | Owner can act from the card or supported digest surface. Drop requires a reason. The action and outcome are recorded. |
| R4 · Must | Waiting-on tag and I'm blocked action. | Owner can identify a teammate, other team, or external dependency; blocked status and reason are visible in the card and team view. |
| R5 · Should | Public response link for dependency owners. | A recipient without a Fireflies account can choose Confirmed, Need more time, or Cannot do this. The response updates the linked card. |
| R6 · Must | One daily digest with one-click actions and mute. | Digest lists commitments due in the next seven days and blocked items. User can mute the digest. Repeated reminders are consolidated. |
| R7 · Must | Team-level status view without individual ranking. | View shows Open, Blocked, Resolved, Awaiting acceptance, and relevant blocker details. No per-person leaderboard or ranking is displayed. |
| R8 · Should | Buyer dashboard. | Dashboard shows resolution trend, drops by reason, and time to first action. Sample or pilot data is clearly labelled. |

## Key state definitions

| State / outcome | Definition |
|---|---|
| Proposed | Detected and presented for owner review; not yet accepted. |
| Awaiting acceptance | Owner action is pending. |
| Open | Owner accepted the commitment and it remains active. |
| Blocked | Progress depends on another person, team, or external party. |
| Resolved – Done | Owner confirms the commitment is complete. |
| Resolved – Reassigned | Responsibility has been transferred and recorded. |
| Resolved – Dropped | Commitment is deliberately discontinued with a reason. |

## Important metric rule

For the project’s North Star Metric, a commitment is considered resolved when it reaches Done, Reassigned, or deliberately Dropped within 14 days. These outcomes should still be reported separately so that a higher resolution rate cannot hide an increase in dropped work.

# 7. UX and notification requirements

- Every card should retain a link to its source meeting and the relevant quote timestamp.

- Overdue commitments should be visually distinguishable from upcoming commitments.
- The owner should be able to understand the next action without navigating multiple tools.
- The digest should consolidate due-soon and blocked items into one daily message.
- Users should be able to mute the digest.
- The team view should explain why an item is blocked and how long it has been blocked, where that information is available.
- External dependency links should disclose what information is being shared and avoid exposing unrelated meeting content.

# 8. Metrics and instrumentation

## North Star Metric

14-day commitment resolution rate = number of eligible commitments reaching a defined resolved outcome within 14 days ÷ total eligible commitments created in the cohort × 100. The baseline is 28%; the target is 45% within six months.

The pilot must define cohort entry, duplicate handling, reassignment treatment, and the timestamp used to start the 14-day window before comparing results.

| Metric type | Metric | Why it matters |
|---|---|---|
| North Star | 14-day commitment resolution rate | Measures whether commitments reach an explicit outcome within the target window. |
| Supporting | Owner acceptance rate | Tests whether proposed cards and ownership suggestions are trusted. |
| Supporting | Time to first action | Measures how quickly users respond to a proposed commitment. |
| Supporting | Cards with due dates | Indicates whether commitments have actionable timing. |
| Supporting | Blocked items cleared within agreed time | Measures dependency progress. |
| Supporting | Nudge-to-action rate | Tests whether the digest prompts useful action. |
| Business | Weekly active teams; dashboard views; retention | Indicates adoption and sustained product value. |
| Guardrail | Digest mute rate; Not mine rate; drops by reason; surveillance complaints | Detects notification fatigue, poor ownership suggestions, misuse, or loss of trust. |

## Proposed event taxonomy

commitment_proposed, accepted, not_mine, reassigned, due_date_set, waiting_on_tagged, blocked_marked, nudge_sent, nudge_clicked, done, dropped.

Event properties should include a pseudonymous commitment identifier, timestamp, source meeting identifier where permitted, status, and relevant action reason. Access controls and data-retention rules require validation with the relevant product and privacy stakeholders.

# 9. Risks, dependencies, and open questions

| Risk | Potential impact | Mitigation / validation |
|---|---|---|
| Cards ignored | Low adoption; commitments remain unresolved. | One digest, simple actions, and pilot measurement of nudge-to-action. |
| Surveillance perception | Reduced trust or employee resistance. | Team-level status only; no individual rankings; validate with reps and managers. |
| Wrong owner proposed | Work is assigned to someone who did not agree to it. | Consent step; Not mine and Reassign flows; track correction rate. |
| External owner lacks account | Dependency workflow cannot be completed. | Public response link with limited, explicit information sharing. |
| Low-quality extracted item | Users lose trust in proposed cards. | Source quote and timestamp; By when? prompt; flag-a-card option. |
| Notification overload | Users mute or ignore reminders. | One daily digest and mute control. |
| Privacy and access | Sensitive meeting information may be exposed through shared links. | Define link permissions, expiry, access logging, and minimum shared context before pilot. |

## Dependencies

- Access to meeting-derived action items and source timestamps.
- Slack and/or email delivery capability for the digest.
- A secure public-link mechanism for external dependency responses.
- Permission and privacy review for external sharing and team-level dashboards.
- Analytics instrumentation and a consistent definition of eligible commitments.

## Open questions

- How should the system identify the dependency owner reliably?
- What privacy rules should apply when a commitment link is shared outside the organisation?
- How should the feature work with teams already using Slack integrations?
- What configuration and access controls do administrators need? Administrators were not interviewed in this research.
- What thresholds for acceptance, digest mutes, and drop reasons should be set after baseline measurement?

# 10. MVP scope and rollout plan

| Phase | Scope | Exit evidence |
|---|---|---|
| Phase 0 – Pilot readiness | Confirm metric definitions, privacy rules, permissions, event tracking, and pilot workflow. Include administrator discovery. | Pilot teams, instrumentation, and guardrails agreed. |
| Phase 1 – Core pilot | Proposed cards, owner consent, due dates, status, Waiting on / I'm blocked, one daily digest, and team-level view. | Users can complete the core lifecycle; key events are captured. |
| Phase 2 – Dependency and buyer experience | Validate public dependency responses and buyer dashboard with pilot users; refine based on feedback. | External response flow and reporting are usable and trusted. |
| Phase 3 – Evaluation | Compare pilot cohorts with the agreed baseline; review qualitative feedback and guardrails. | Evidence-based decision to iterate, expand, or stop. |

### Pilot recommendation

Start with two or three design-partner teams, as proposed in the capstone. Measure the 14-day resolution rate and supporting/guardrail metrics. Because the six-month target is a product objective rather than a validated forecast, the pilot should first test usability, adoption, data quality, and early directional impact.

## 11. Prototype and supporting deliverables

**Interactive concept prototype:** https://prototype-jayeshparihar-fireflies.lovable.app/

**Presentation video:**
https://docs.google.com/videos/d/1QSgAdmdterJbTSX83XRY1lEwKf9WvQEogKgqtLzk15k/play?usp=sharing

The prototype demonstrates Home, Meetings (Before / After), My Commitments, Team View, Buyer Dashboard, and Daily Digest preview. It uses illustrative sample data and should not be interpreted as a live Fireflies integration or evidence of measured product impact.

## 12. Decisions and assumptions to validate

| Item | Current position |
|---|---|
| Product concept | Commitment Cards is a proposed feature concept for Fireflies.ai, not an existing production feature claim. |
| Baseline | 28% 14-day resolution rate, as stated in the capstone project. |
| Target | 45% within six months; to be validated through a pilot and subsequent measurement. |
| Resolution definition | Done, reassigned, or deliberately dropped within 14 days; report each outcome separately. |
| RICE | Prioritisation scores are estimates, not measured user or business data. |
| Prototype metrics | All displayed dashboard figures are sample data. |
| Research limitation | 19 interviews across three companies; administrators were not interviewed; findings are qualitative and directional. |
